

## COSMO Text Module

**Integrated Text Management for  
Microsoft Dynamics 365  
Business Central**

# COSMO Text Module

COSMO Text Module is an extended text management system that goes far beyond the functional scope of the standard text modules available in Microsoft Dynamics 365 Business Central.

Text modules are blocks of text lines for a defined language, a specific period, and a specific position (header/footer). Each line can have a specific markup (italic, bold, underlined) and color (see Fig. 1). The print control specifies whether the text line is printed on pre-configured reports or only appears as a pop-up message in special tables, such as for sales or purchasing documents.

Texts are particularly important for communication with customers and suppliers. Item data can be stored as line text and the sales/purchase order (customer/vendor) data can be stored as header/footer text. Recurring texts do not have to be entered each time. They can be transferred to the documents from the standard templates and master data, especially for items, customers, and suppliers. COSMO Text Module makes it easier to store additional information for other master data, such as resources or G/L accounts as well as in production, and for the standard texts in Microsoft Dynamics 365 Business Central.

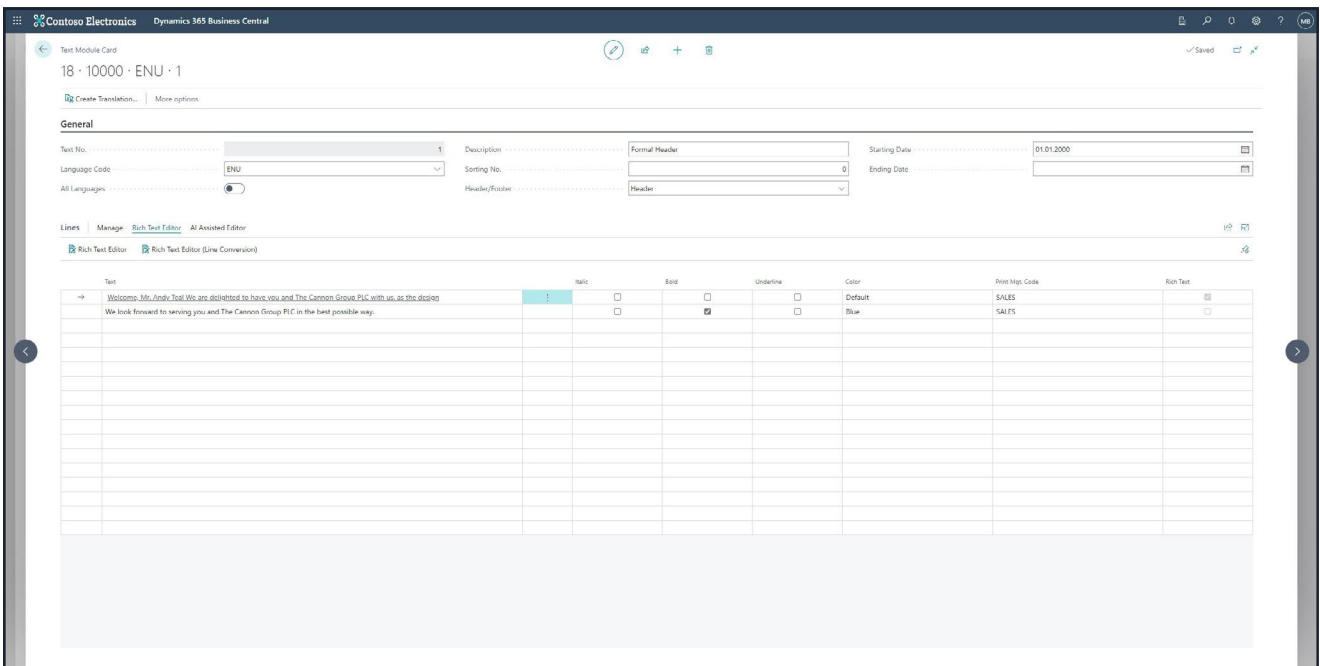

Fig. 1: Text module with text lines

Similar to the text modules in standard Dynamics 365 Business Central, the text modules in **COSMO Text Module** can be defined in a specific language and provided with date-related information.

You save time and storage space by saving identical text modules once in the database and reusing them on various occasions. You also avoid redundant data storage.

Text modules for master data can always be edited, while the editing of text modules in sales orders or purchase orders depends on the respective status. Posted and archived documents are excluded from text editing.

The texts stored in the master data are copied to the document according to the setup in the print control management.

- Customer or vendor-related texts are copied to the document header or footer.
- Item text is copied over to the line text automatically below the description.
- Texts are also considered for production and service documents.

The AI-supported rich text editor integrates several functions for creating, revising, and translating texts. AI templates can be used to capture instructions for the quick and standardized creation of texts (see Fig. 2).

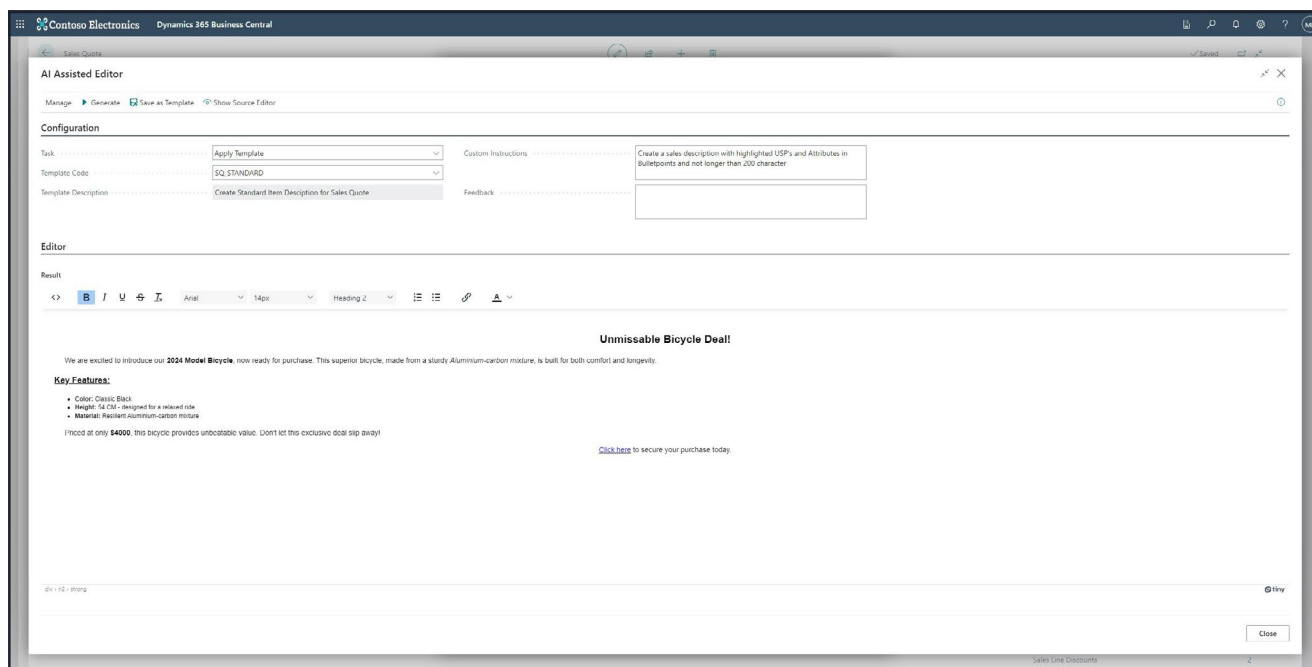

Fig. 2: AI-supported rich text editor

Texts are attached manually or automatically and printed on predefined or customized reports (see Fig. 3).

In addition to printing, selected texts can be shown as pop-up messages to ensure that important information is observed in the process flow.

## Benefits

The advantages are

- Simple composition of texts with formatting directly in Microsoft Dynamics 365 Business Central
- Multilingual long text in document lines or as header/footer text
- AI-supported assistance for formulations and translations

## Target Markets

- Horizontal

## Buyers Personas

- Purchasing and sales
- Marketing and sales
- Warehousing
- Quality assurance and management
- Production and service
- IT and organization

## Benefits

- Storing texts in many places in Microsoft Dynamics 365 Business Central
- Simple formatting, design, and translation of texts with the AI-supported rich text editor
- Output of texts on vouchers and in reports
- Centralized print control of text lines depending on the document type
- Insertion of texts as pop-up messages with situation-specific information for the user
